

Combining Videosign's secure digital contracting technology with local partnership and client support in South Africa.

IDENTITY AND SIGNING ASSURANCE

A signature tells you a document was signed.
Videosign helps you evidence who signed it.

For sensitive and high-value transactions, a signature alone may not provide the assurance you need.

Videosign connects identity, signature and evidence within the same transaction.

The right level of assurance for every transaction

Built-in identity verification

Verify the signer within the Videosign journey.

Enhanced verification when required

Add biometric, document, facial/liveness, bank-based and KYC/AML checks through integrated providers.

Higher-assurance electronic signatures

Choose signature assurance appropriate to the transaction, including QES and applicable AES workflows.

Evidence beyond the signature

Capture timestamps, document activity, verification details and video evidence in one audit trail.

Know who signed. Keep the evidence.

Scan to see Videosign in action.
